# Stages of integration of Supply and Use tables in National Accounts in Germany

Peter Bleses Federal Statistical Office of Germany

# 1. Supply and Use tables as part of National Accounts in international concepts

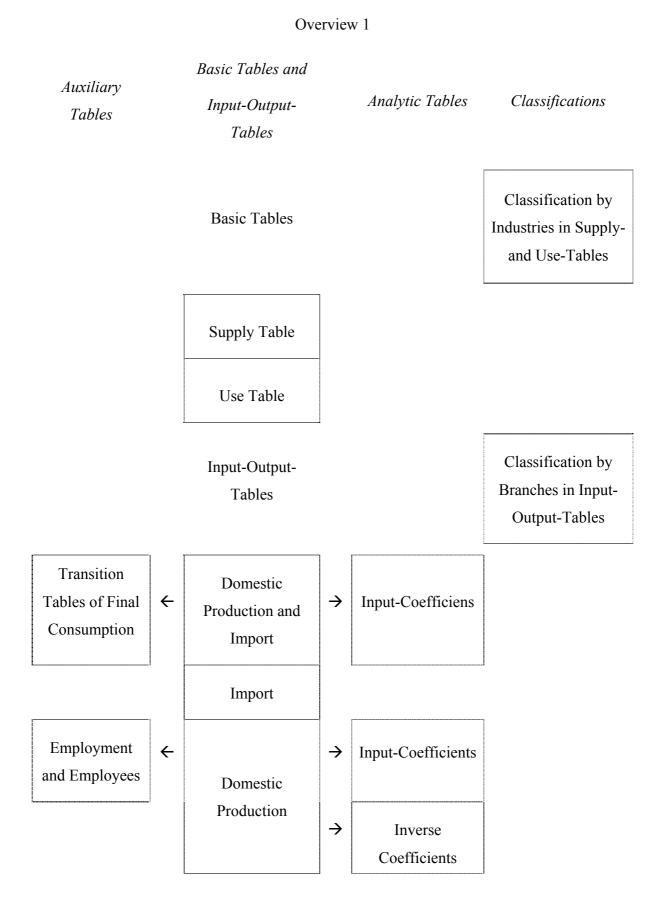

The System of National Accounts clearly points at the relevance of supply and use tables "for ensuring the numerical consistency of data drawn from different sources" for National Accounts (SNA 1993 of the United Nations, Chapter XV. 'Supply and Use Tables and Input-Output', paragraph 15.3). In addition, the same paragraph of the SNA stresses the meaning of supply and use tables as "a framework for checking the consistency of statistics on flows of goods and services obtained from quite different kinds of statistical sources".

Derived from the SNA 1993, the European System of Accounts (ESA 1995) is an obligatory framework for National Accounting of member states of the European Union. As "important statistical purposes", paragraph 9.11 of the ESA states "identifying gaps and inconsistencies in basic data sources" and "checking and improving the consistency, plausibility and completeness of figures in the Supply and Use tables and the derived figures (such as those in the production accounts)". Thus, Supply and Use tables calculated within the framework of Input-Output are playing an important and active part in international concepts of National Accounts with special relevance for the production approach and the expenditure approach. Supply and Use tables were already outlined in the SNA 1968 of the United Nations. But they were not addressed in the first European System of Account (i.e. ESA 1970 and 1979 2. ed.). Meanwhile, they are treated extensively both in the SNA 1993 and the ESA 1995.

# 2. Supply and Use Tables in National Accounts of Germany

In the Federal Statistical Office of Germany, Gross Domestic Product and Input-Output tables are both estimated or calculated within the same framework of concepts, definitions and classifications, according to the ESA 1995. So, Supply and Use tables of the reporting year 1995 were calculated based on the concepts of ESA 1995 and within the Input-Output framework of the Federal Statistical Office. Since 1997, those calculations are taking place annually. As the results are compatible with Gross Domestic Product estimates, they are effectively broadening the data supply of National Accounts, especially for analyses of production and final uses in Germany.

Within the national system of Input-Output, symmetric tables as well as Supply and Use tables are provided since the report for 1978. In this respect, the Federal Statistical Office has accommodated early to the international development in the domain of Input-Output. Today, Supply and Use tables are inherent parts of the national statistical publication programme.

# The present publication programme of Input-Output in Germany is shown in overview 1.

3

The compilation and publication of Supply and Use tables as well as of Input-Output tables of the Federal Statistical Office is directly referring to the respective EU-legislation. As already mentioned, Supply and Use tables are part of the ESA programme only since the reporting year of 1995, but they have been part of the publication programme of the Federal Statistical Office since 1978. Deviating from the transmission programme of Eurostat, in national publications the economic transactions of supply and use are presented by 71 product groups (branches) and 59 industries. The input-output tables are presented by 71 branches and by 71 groups of homogeneous production. In the annex of this paper there can be found the latest Supply- and Use tables for Germany of the reporting year 2003. Besides the Supply table, the Use table and the Input-Output tables, the Federal Statistical Office offers additional data for the tables by 71 branches including data of employment and employees. Further, there is a transition table (cross table) for final consumption of private households by 71 product groups and by 41 purposes. The Input-Output data are completed by analytic tables. As supplement for Input-Output tables of domestic production there are tables of input coefficients and inverse Leontief coefficients. Finally, overviews of the classifications for industries and for products used throughout the tables have been prepared. The results of all Input-Output calculations are published in "Series 18, National Accounts, Special Series 2, Input-Output". The publications are also available in the "Statistik-Shop" of the Federal Statistical Office and can be downloaded free from the internet at *http://www.destatis.de/shop*. The issues of the series published recently are comprising detailed results for the reporting years 2000 to 2003. The figures are corresponding to the annual results of National Accounts (Series 18, 1.4), the revision of 2005 taken into account. The data of Input-Output will regularly be adjusted to the latest available data of GDP of a certain reference year. Further information and advice is provided by the team of Input-Output at *input-output@destatis.de*.

### 3. State of integration at the National Accounts revision of 2005

Estimation of Gross Domestic Product and calculations for Supply and Use tables were made independent from each other to a large extent until the revision of 2005. Consistency of the figures has been achieved ex post by adjusting the results of the Input-Output calculation to the estimates of the production approach and the expenditure approach, taking them as benchmark data. As the Supply and Use tables were not available in time for reconciling procedures concerning Gross Domestic Product estimation, reconciliation of the different approaches for Gross Domestic Product focused on the aggregates only. During the activities for the revision of 2005, for the first time consistency could be achieved between results of the production approach broken down by 59 industry groups on the one hand and the expenditure approach broken down by 59 product groups on the other hand.

In Germany, revisions of National Accounts are due every 5 to 10 years. The essential improvements introduced by the revision of 2005 were: previous year prices and chain linking, use of new deflation methods ( hedonics, among others), new arrangements for calculating and distributing financial services (so called FISIM) and integration of new data sources, e.g. the Structural Business Survey for the services industries.

Furthermore, Input-Output **partially** supports the elaboration of Gross Domestic Products estimates in many ways: Input-Output regularly provides weighting schemes and price indices for the deflation especially of output, intermediate consumption, inventories, imports and exports. A transition table for the final consumption of private households is calculated too. This table combines annual consumption of private households by purposes as it is presented in tables related to Gross Domestic Product with groups of products as they are used in Input-Output. So, the aggregate of final consumption is completely balanced between GDP and Input-Output. Additionally, one kind of relation between both is visible. However, if inconsistencies should occur during commodity flow checks of Input-Output calculation that would also affect the aggregate level of, say final consumption of households, it is often too late for changes, with respect to deadlines for publication. As a consequence, Input-Output figures have to be adjusted to the aggregate figures to preserve compatibility. In the past, only revisions offered the opportunity to integrate information into the workflow of Gross Domestic Product estimation, which reflected the detailed view of Input-Output tables on complete, consistent and plausible figures of aggregates.

## 4. The ESA transmission programme supports the process of integration

The Council of the European Union has enacted the ESA regulation, which besides the ESA 1995 concepts and methods is also dealing with a transmission programme for accounts and tables to the Statistical Office of the European Union, Eurostat. The accounts and tables have to be compiled according to the concepts and methods of the ESA 1995 and they are obligatory for all member states of the European Union. By this legal binding, the ESA 1995 is different from its predecessors, which expressed recommendations only. At present, a revised form of the transmission programme is discussed. The present state of the transmission programme is shown in overview 2.

# Overview 2: Transmission of Input-Output-Tables to Eurostat according to ESA 1995 and the revised transmission programme

Year of transmission	Reporting years	Type of table
2007	2000 to 2004, annual (time lag t + 36)	Supply table at basic prices, transformation to purchasers' prices; at current prices and previous year prices; by 60 product groups x 60 industries
2007	2000 to 2004, annual (time lag t + 36)	Use table at purchasers' prices; at current prices and previous year prices; by 60 product groups x 60 industries
2008	2000, 2005, quinquennial (time lag t + 36)	Symmetric Input-Output-tables at basic prices; for total supply, for domestic production only, for imports only; at current prices; by 60 product groups x 60 groups of homogeneous production

The transmission programme obligates member states to deliver Supply and Use tables at current prices and at previous year prices 36 months after the end of the reporting year to the Statistical Office of the European Community, Eurostat. These tables facilitate the integration of Gross Domestic Product estimation and calculation of input-output for the preparation of final results. To improve timeliness while integrating both systems of calculation, an earlier calculation of preliminary Supply and Use tables and an additional extrapolation of the tables for the reporting year following is envisaged in Germany. But detailed original calculations are only possible when the respective detailed statistical sources are largely available. This is normally the case about 18 months after the end of the reporting year. Then, the detailed structure of production by industries and the structure of imports by product groups are calculated from scratch for the supply table. The commodity flow method is providing the methodical background for a first, raw version of an inputoutput table, which is not yet adjusted to any benchmark figures except the totals of production and imports. The supply of about 3000 product groups, distributed to 71 groups of homogeneous branches (and different categories of final use) is the starting point. Further on, the table is transformed to a use table, which presents industries instead of branches. The **extrapolation** of the Supply and Use Tables utilizes the tables of the previous year, and indicators from statistical sources as much as are available at that time. To the extent that no indicators are available, structures of the previous year are used.

## 5. From partial to complete integration

As already mentioned, ex ante consistency of detailed results of the production approach by 59 industries and the expenditure approach by 59 product groups could be achieved by means of Supply and Use tables for the first time during the revision procedures of 2005. With the Supply and Use tables available for the reporting year 2000, Input-Output had reached a timeliness which allowed a **complete integration** of Gross Domestic Product estimation and Input-Output calculation for the first time. It is envisaged to further intensify the exchange of information during the Gross Domestic Product estimation procedures and the calculation of Input-Output. That is to utilize Supply and Use tables at current prices and at previous year prices for **reconciling production and expenditure annually**.

Thus, quantitative significant discrepancies between the production approach and the expenditure approach can be recognized early and consequently eliminated on a detailed level of products. So, for the deadline of annual Gross Domestic Product estimates in summer 2006, useful findings from Input-Output calculation at current prices for the reporting year 2002 could be integrated into the estimation procedure.

The integration of Gross Domestic Product estimation and the calculation of Input-Output are intended to take place from now on for the annual GDP estimates in summer. As a rule, the results of **four reporting years back** should be worked over then. Especially in the face of the strict quality standards set by the European institutions for estimating Gross Domestic Product, reconciling the estimates with input-output data seems to be favourable.

As an example, this also holds for the standards set for GNI as reference for the contribution to the EU own resources. Until the end of 2007, supply and use tables for the years 2001 to 2004 at previous year prices will be available.

These tables are providing comprehensive and detailed information for analysing the development of economic relations in Germany at real terms. Moreover, from summer 2008 on, Supply and Use tables at previous year prices can be utilized for a final estimation of the annual figures of Gross Domestic Product.

Together with supply and use tables at current prices, the tables at previous year prices and the implicit prices indices, which are derived from both kinds of tables, are forming an advanced instrument for plausibility checks of the real and the nominal Gross Domestic Product.

To reconcile production and expenditure flows during the estimation procedure of Gross Domestic Product, Supply and Use tables of maximum three consecutive reporting years will be regularly available:

For a period of one and a half year back from the present year (t+18 months; at present, this means for reference year 2005), there are no data sources which could help to calculate Supply and Use tables from scratch.

Therefore it is intended to generate preliminary Supply and Use tables by means of extrapolation techniques to utilize the results for reconciling procedures. During the period of t to t+18, some detailed extrapolations can be performed, which for instance refer to commodity flow and to data of production and intermediate consumption by industries. They also refer to data of Structural Business Statistics for manufacturing industries and to VAT statistics.

For a period of two and a half year back from the present year (t+30 months; at present, this means for reference year 2004), Supply and Use tables calculated from scratch and in detail will be part of the reconciling procedure for the first time. Therefore, the annual calculations with a time lag of 30 months will be at the centre of co-operation of Gross Domestic Product estimation and input-output calculation. As one result of the reconciliation process, the Supply and Use tables will be transmitted to Eurostat by the end of the year (t+36), according to the transmission programme of ESA.

About three and a half year from the reporting year (t+42 months; affecting reference year 2003 at present) final results may be recalculated. As a rule, only minor changes will occur as consequence of these calculations, as most of the data sources and the originally calculated Supply and Use tables were already taken into account.

The **process** of intensifying the integration of Gross Domestic Product estimation and Input-Output calculation is based on three steps of the calculation procedures. For a start, numerous partial reconciling measures take place at a detailed level of working versions of the tables.

The more the first step is a success in revealing inconsistencies, the easier a second step will be, which is to reconcile Supply and Use tables on the basis of estimations of Gross Domestic Product and Input-Output calculation. The upshot is a preliminary Gross Domestic Product, which is exactly the same when calculated by the production approach and by the expenditure approach.

In a third step, the results of the Input-Output calculation of the first two steps are put forth to a process of total reconciliation, which comprises other parts of the system of National Accounts as the Quarterly Accounts, the Distribution Accounts, the Employment Account, the Fixed Capital Account and the Sector Accounts. The results of those reconciling procedures will possibly affect the Supply and Use tables too.

10

# Summary

Over the years, an ever growing co-operation in estimating Gross Domestic Product and in calculating Input-Output has evolved. Though the results of estimating Gross Domestic Product are still providing benchmark figures for the Input-Output tables, the data from Input-Output calculation inversely are of major significance to the production approach and the expenditure approach for estimating the Gross Domestic Product. So, the detailed data of Supply and Use tables broken down by product groups and industry groups is applied for checks of consistency of the production side and the expenditure side of the economy. While formerly the results of estimating Gross Domestic Product of both the production approach and the expenditure approach were reconciled at an aggregate level, Input-Output data are offering a way for checks of consistency on a more detailed level of product groups and industry groups. In the past, these detailed checks were only possible ex post during greater revisions and during final estimations of Gross Domestic Product respectively, because current Supply and Use tables were not yet available.

In the course of the revision of 2005 and by means of Supply and Use tables, for the first time ex ante consistency could be achieved by detailed results of the production approach broken down to 59 industry divisions on one hand and by the results of the expenditure approach broken down to 59 product groups on the other hand. Beyond that and on the occasion of the summer deadline of 2006, useful findings from the Input-Output calculation of the reporting year 2002 could be utilized for the reconciliation procedures of the estimation of Gross Domestic Product. The integration of Gross Domestic Product estimation and the Input-Output calculation is now intended to be currently effected during the annual estimations of Gross Domestic Product for the summer deadline, when four reporting years are to be worked over regularly. Especially in the face of strict standards set by European institutions for the quality of Gross Domestic Product estimation, reconciling by means of Input-Output data is advantageous.
