ABSTRACT:

A new graphical user interface for balancing the system of supply and use tables (SUT) was introduced during the latest revision of the Finnish national accounts system. In the interface, current priced product group data are balanced both manually and automati-cally at basic prices.   The graphical interface is executed as a standard Windows MDI application, while the SUT data are processed with the SAS software. The adoption and testing of the interface were implemented in connection with the compilation of SUT data for the year 2006.
