ABSTRACT:

To analyse, separately, the direct (1st order) impacts and the indirect and induced (2nd order) impacts of the Bolsa Família Programme in the Brazilian economy, especially the impacts on the income distribution, this study applies a SAM-based model, with an interregional Social Accounting Matrix created for this end, as a means to include inter-sectorial, inter-regional and inter-institutional relations. This matrix combines the information from an interregional Input-Output table with data from the Brazilian National Accounting System and household surveys.
