COUNTRY: BRAZIL

KEYWORDS: INPUT-OUTPUT MODEL ; INCOME DISTRIBUTION ; LEONTIEF-MIYAZAWA

PAPER CONFERENCE CODE: 98

FULL PAPER IN CD?: YES

ABSTRACT:

Brazil is a country with many social and economic problems, the majority of them linked to its high level of poverty and perverse income distribution. In order to contribute to better understand those questions, our paper uses the Brazilian 2005 input-output matrix to verify which of its sectors, after a positive shock on demand, increase most the income of the poorest segments of society. Focused on that, Brazil's input-output matrix was aggregated into a 39x39 sectors, and the income and consumption data were disaggregated into levels according to 2003 Household Budget Report (POF) and Annual Social Information Report (RAIS).
