Extended Supply and Use Tables of Mexico. Base Year 2018

Topic: Special Session: Extended SUTs and IOTs - experiences and techniques of national statistical institutes and international organizations
Author: Jose Teran-Vargas

This research has the purpose to solve the problem of extending the Supply and Use table (SUT) for Mexico for the base year 2018 given the information available and constraints and also improving the Extende SUT (ESUT) compiled for the year 2013. The purpose is also to show how can a National statistics Institute explore and process its sources of information to deliver a ESUT.

The reasearch shows how the Terms of Reference published by OECD are flexible and this gives rise to proposals for extensions. In the case of Mexico, given the sources of information there can be some propositions of disagregation, based on the establishment as the economic unit made posible in a five years basis through the information from the Economic Census 2018 linked to foreign trade records and other administrative Records and surveys. These extensions and the sources of information collected by the Institute allow the extension for the focus on property, size, formality and informality, and exports oriented production. There are also additional extensions to be published later in 2024, such as the extensions of the components of the Value Added of the Exporter Focus and the Table of Use of the Exporter Focus by domestic and imported origin.
